

A. Indices After

This appendix identifies the tables and indices in each of the databases in the Workflow Server after the Server and Database Rebuild on the Easter weekend, dated 09 Apr 07. The databases are presented in alphabetical order. Comparison of Appendix B - Indices Before, with this Appendix, will provide ready identification of the removal of databases, and the movement of objects affected in the database amalgamation. Comparison of the relevant section in the two Appendices, will provide ready identification of the exact Indexing changes that were made.

The two Appendices provide the essential audit trail of the work done with regard to tables and indices in all the databases: any 'before' object can be either located here in its changed form, or confirmed as removed. Note that due to the removal of substantial duplicate rows during the database amalgamation and table merge operations, row counts cannot be readily compared.

The reports are produced using the *Software Gems Server & Database Administration* scripts, the columns provide relevant details about the index, along with row counts and space used, and a summary is included at the end.

B. Indices Before

This appendix identifies the tables and indices in each of the databases in the Workflow Server before the Server and Database Rebuild on the Easter weekend, dated 05 Apr 07. The databases are presented in alphabetical order. Comparison of Appendix B - Indices Before, with this Appendix, will provide ready identification of the removal of databases, and the movement of objects affected in the database amalgamation. Comparison of the relevant section in the two Appendices, will provide ready identification of the exact Indexing changes that were made.

The two Appendices provide the essential audit trail of the work done with regard to tables and indices in all the databases: any 'before' object can be either located here in its changed form, or confirmed as removed. Note that due to the removal of substantial duplicate rows during the database amalgamation and table merge operations, row counts cannot be readily compared.

The reports are produced using the *Software Gems Server & Database Administration* scripts, the columns provide relevant details about the index, along with row counts and space used, and a summary is included at the end.
